

Comparison of Wind Resistance and Environmental Friendliness of Off-Grid Solar Containerized Units

Overview

What are grid-connected and off-grid PV/wind/battery hybrid systems?

The considered grid-connected and off-grid PV/wind/battery hybrid systems consisted of PV modules, WTs, batteries, converters, and the power grid, as shown in Fig. 11. The main energy storage system consisted of batteries, and the solar PV modules and WTs were the main energy sources that were combined to supply power to the building.

What is the most economically feasible solar/battery/wind hybrid energy system?

The study found that the most economically feasible system was the grid-connected PV/battery/wind hybrid energy system. Olatomiwa et al. [10] analyzed the technical and economic implications of a hybrid system consisting of solar and wind energy powered for a specific remote mobile base station in Nigeria.

Does hybridization of solar & wind systems cover household energy needs?

The results demonstrate that this area has a good solar and wind capacity, and therefore, hybridization of both PV and wind systems covers household energy needs during the year and provides a large amount of energy that can be stored in battery storage for use at peak hours of electricity.

Are grid-connected systems more economical than off-grid systems?

The findings indicated that grid-connected systems with smaller NPC and COE values are more economical than off-grid systems. The grid-connected hybrid system can produce CO₂, while the off-grid hybrid system produces no emissions. The increase in the proportion of wind and PV power in the hybrid system can reduce CO₂ emissions.
