Do solid-state batteries still need BMS

Overview

Is there a solid-state battery management system?

However, a comprehensive solid-state battery management system to complement these batteries has not yet been systematically proposed. We attempt to construct a management system for solid-state batteries based on various characteristics, considering both the demand- and supply-side.

Why do you need a battery management system (BMS)?

One of the first characteristics that a customer pays attention to is the time required for a full charge and the travel range before another charge is needed, so fast charging time and long driving range require improved BMSes to guarantee safe operations and long battery life.

What are the components of a battery management system (BMS)?

A typical battery management system (BMS) consists of the following main components: Battery Management Controller (BMC), Voltage and Current Sensors, Temperature Sensors, Balancing Circuit, and Power Supply Unit.

How does BMS calculate battery capacity?

A Battery Management System (BMS) calculates key battery metrics, including the available battery capacity compared to its full capacity, known as State of Charge (SoC).
