

# **Energy storage distribution network planning**

## Overview

---

In the past decade, energy storage systems (ESSs) as one of the structural units of the smart grids have experienced a rapid growth in both technical maturity and cost effectiveness. These devices propose divers.

What is active distribution network-network planning model?

To achieve economic and safe operation of the distribution network, an active distribution network-network planning model considering the dynamic configuration of energy storage system energy storage is constructed. This model focuses on energy storage batteries with high ease of use, high modularity, and strong mobility.

How does energy storage help a distribution network?

By effectively utilizing energy storage equipment, distribution network companies can transfer the electricity demand of users over time, shifting the electricity demand from high electricity prices and high load periods to low electricity prices and low load periods, thereby reducing the cost of purchasing electricity from the main grid.

Can dynamic energy storage configuration improve the reliability index of electricity consumption?

The reliability index of electricity consumption was improved. The distribution network framework planning method that considers dynamic energy storage configuration can reduce the network construction cost of distribution network operators, while improving the economic benefits of distribution network operators.

Can energy storage planning promote the realization of low-carbon power grids?

When planning energy storage, increasing consideration of carbon emissions from energy storage can promote the realization of low-carbon power grids. A two-layer energy storage planning strategy for distribution networks considering carbon emissions is proposed.
