

How long can the flywheel energy storage last

Overview

What is the difference between a flywheel and a battery storage system?

Flywheel Systems are more suited for applications that require rapid energy bursts, such as power grid stabilization, frequency regulation, and backup power for critical infrastructure. Battery Storage is typically a better choice for long-term energy storage, such as for renewable energy systems (solar or wind) or home energy storage.

How does a flywheel energy storage system work?

Flywheel Energy Storage Systems (FESS) rely on a mechanical working principle: An electric motor is used to spin a rotor of high inertia up to 20,000-50,000 rpm. Electrical energy is thus converted to kinetic energy for storage. For discharging, the motor acts as a generator, braking the rotor to produce electricity.

How long does a flywheel last?

Flywheels can be expected to last upwards of 20 years and cycle more than 20,000 times, which is high in comparison to lead-acid (2,000 cycles), lithium-ion (<10,000 cycles) and sodium-sulfur batteries (2,500-6,000 cycles). Another advantage is the flywheel energy storage system's ability to provide energy with little start up or transition time.

How much does a flywheel energy storage system cost?

The cost of a flywheel energy storage system is \$6,000. Each kilowatt is priced at \$1,333 a kilowatt. This flywheel energy storage design is a viable electricity source in homes. It functions to meet peak power demands within 25 seconds, allowing for significant savings in energy costs.
