## Overview

---

How many Watts Does a solar inverter use?

Depending on where they fall in that band and the size of their solar array, they will likely use a 3, 5, or 10kW inverter. You also need to consider surge watts and voltage drop. Surge watts are the extra power required to start appliances that have motors, such as refrigerators and air conditioners.

How big should a solar inverter be?

To account for power losses assume an 80 percent efficiency. Your solar inverter should have a similar or slightly higher wattage rating than the DC output of your solar panels (which in this case is 4.5 kW). You can size it between 1.15 and 1.5 times larger. The rule of thumb is to size your inverter 1.25 bigger than your solar array.

What are inverter specifications?

Specifications provide the values of operating parameters for a given inverter. Common specifications are discussed below. Some or all of the specifications usually appear on the inverter data sheet. Maximum AC output power This is the maximum power the inverter can supply to a load on a steady basis at a specified output voltage.

What is the peak output of a solar inverter?

The peak output of an inverter is typically over double its rated output power. Input voltage range is the minimum and maximum input voltage at which an inverter will function. If the voltage from your solar array is below the minimum (also called the startup voltage) the inverter will not switch on.
