

# **London mobile communication network base station**

## Overview

---

What is a mobile phone base station?

A mobile phone base station provides coverage to a geographic area known as a “cell”. Cells are aligned next to each other in a similar pattern to a honeycomb, and it is for this reason that mobile phone networks are sometimes referred to as “cellular” networks.

How do base stations work?

Base stations transmit and receive radio waves to connect the users of mobile phones and other devices to mobile communications networks. The strength of the radio waves from base station antennas reduces rapidly with increasing distance and the levels at locations where the public can be exposed tend to be small.

What is a GSM base station?

GSM is not only the foundation of modern mobile telephony, but also a technology that continues to evolve and adapt to new needs and challenges in the telecommunications market. A single base station can cover one or more cells of a telecommunications network.

How do mobile networks work on the London Underground?

Interactive map of mobile network deployments on the London Underground. Mobile connectivity on the London Underground is provided by a combination of leaky feeders in tunnels and DAS units in stations.

## London mobile communication network base station

---

### London Underground mobile connectivity

Mobile connectivity on the Tube Mobile connectivity on the London Underground is provided by a combination of leaky feeders in tunnels and DAS units in stations. The programme is operated ...
