Overview

Can solar panels be installed on a building rooftop?

The building rooftop presents a wealth of spatial opportunities for promoting the utilization and conservation of solar energy. The installation of photovoltaic panels on rooftops is a feasible and convenient method for integrating renewable energy sources into buildings.

Is your roof fit for a solar panel system?

Not every roof is fit to host a solar panel system. A flat angle or partially shaded, inadequate space – in such scenarios, efficiency becomes poor. Hence, it requires proper analysis before final installation from an experienced solar installer by conducting site inspections, and rooftop evaluation for efficient production.

Do solar panels reduce heat absorbed by a cool roof?

In the absence of photovoltaic (PV) panels, the heat absorbed by a cool roof (characterized by high reflectivity) is reduced by 65.6% compared to a conventional roof (with low reflectivity). However, once PV panels are installed, the disparity in heat gain between roofs with varying reflectivity levels is narrowed to approximately 10%.

How do I know if my roof is suitable for solar?

Before installing solar panels, assess your roof to ensure it is suitable for solar installation. Start by examining the roof's condition. It should be sturdy and have at least 10-15 years to function. If the roof is damaged, consider repairing or replacing it to avoid complications later.
