Types of grid-connected inverters

Overview

What are the different types of grid-connected inverters?

Aside from the modes of operation, grid-connected inverters are also classified according to configuration topology. There are four different categories under this classification. Central inverters, which are usually around several kW to 100 MW range. String inverters, typically rated around a few hundred Watts to a few kW.

What are the different types of solar inverters?

There are several types of inverters that might be installed as part of a solar system. In a large-scale utility plant or mid-scale community solar project, every solar panel might be attached to a single central inverter. String inverters connect a set of panels—a string—to one inverter.

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.

How are inverters classified according to interconnection types?

Inverter classification according to Interconnection types is discussed in EME 812 (11.4. Grid connection and role of inverters). Aside from the modes of operation, grid-connected inverters are also classified according to configuration topology. There are four different categories under this classification.
