## Overview

What is a battery management system (BMS)?

A Battery Management System (BMS) is a crucial component in any rechargeable battery system. Its primary function is to ensure that the battery operates within safe parameters, optimizes performance, and prolongs its lifespan. A BMS achieves this by monitoring individual cell voltages, temperatures, charging/discharging cycles, and current flow.

How do battery management systems work?

Battery management system (BMS) is technology dedicated to the oversight of a battery pack, which is an assembly of battery cells, electrically organized in a row x column matrix configuration to enable delivery of targeted range of voltage and current for a duration of time against expected load scenarios.

What is a battery management controller (BMC)?

2. Battery Management Controller (BMC) At the core of the BMS is the Battery Management Controller (BMC), which processes data from sensors and takes appropriate actions. The BMC is responsible for controlling the charging and discharging cycles of the battery, cell balancing, and overall system diagnostics.

What is a BMS used for?

A Battery Management System (BMS) is widely used in various applications such as electric vehicles (EVs), energy storage systems (ESS), uninterruptible power supplies (UPS), and industrial battery applications.
